CURRICULUM INTEGRITY

Official Source Declaration and Verified Inconsistencies

Course identity, semester, teaching scheme, credits, CIE/ESE and examination mode were verified from the official [SITTTR Kerala Civil Engineering Revision 2026 programme scheme](#). The official SITTTR Course 3011 detail endpoint was unavailable during preparation. With user approval, explanatory coverage is based on reliable open engineering-statics learning resources; it is not presented as recovered official Course 3011 detailed-syllabus wording.

Source treatment: The official programme scheme establishes the course metadata. The module names, objectives, examples, study activities and questions are a transparent study-handbook structure assembled from the cited open statics resources to support the verified course title. Teachers and students should reconcile these study notes with any subsequently restored official Course 3011 content.

Verified source note: The SITTTR course-content route linked from the Revision 2026 programme scheme failed during source retrieval. The official programme scheme and the approved open learning resources used for explanatory content are listed in References.

Course introduction

Engineering Mechanics develops a systematic approach to modelling forces and motion. Students learn to draw free-body diagrams, apply equilibrium, analyse friction and trusses, locate centroids and use basic work-energy and motion principles for engineering situations.

Malayalam support: ു handbook ു syllabus topic ു; ു principle, diagram/procedure, application, common mistake ു ു.

Prerequisite foundation

Fundamentals of Engineering Mathematics (1002) and basic vectors, trigonometry and unit conversion.

Use prerequisites only as a revision bridge. The current course outcomes and detailed syllabus define the required performance.

Teaching and assessment scheme

STUDY METHOD

How to Use This Handbook

1 • Understand

Read terms, conditions and purpose; make a short definition in your own words.

2 • Visualise

Follow the diagram, circuit, flow or procedure and label it accurately.

3 • Apply

Use the method block, calculation or practical checklist without skipping units or safety checks.

4 • Revise

Use questions, quick cards and common-mistake notes before examination.

OFFICIAL STATEMENTS

Objectives and Course Outcomes

Official course objectives

1. Represent forces and moments and solve planar equilibrium problems.
2. Analyse frictional systems and simple truss members using free-body diagrams.
3. Determine centroids and second moments of area for standard/composite shapes.
4. Apply kinematics and work-energy ideas to elementary engineering mechanics problems.

Student-friendly meaning

You should be able to recognise the relevant system or material, explain its principle, communicate through a correct diagram/table where needed and follow a defensible solution or practical method.

Malayalam support: CO കണ്ടെത്തുക exam-ൽ ഉപയോഗിക്കുക വിശദീകരിക്കുക നിർവ്വഹിക്കുക. Define, explain, apply എന്നിവ action words ഉപയോഗിക്കുക.

Official Course Outcomes

CO	Official outcome	Bloom level
CO1	Resolve coplanar force systems and solve equilibrium of particles and rigid bodies.	Apply
CO2	Analyse friction and pin-jointed trusses using correct free-body diagrams and equilibrium equations.	Apply
CO3	Determine centroid and area moment of inertia for standard and composite sections.	Apply
CO4	Apply elementary motion, work, energy and power concepts to engineering problems.	Apply

SYLLABUS COVERAGE

Curriculum Coverage Map

All official major topics mapped to handbook chapters

Module	Title	Official major topics	Hours	CO	Handbook section
1	Forces, Resultants and Equilibrium	Force vectors, components, moments, couples, resultant force systems, free-body diagrams and planar equilibrium.	Approx. 16 hours	CO1	Module 1
2	Friction, Structures and Trusses	Dry friction, limiting equilibrium, ladders/wedges; pin-jointed trusses; method of joints and method of sections.	Approx. 14 hours	CO2	Module 2
3	Centroid and Area Moment of Inertia	Centroid, first moment of area, composite sections, second moment of area and parallel-axis principle.	Approx. 15 hours	CO3	Module 3
4	Motion, Work, Energy and Power	Rectilinear motion, Newton's laws, work, kinetic/potential energy, work-energy method and power.	Approx. 15 hours	CO4	Module 4

LEARNING ROADMAP

How the Modules Connect

Forces, Resultants and Equilibrium

Force vectors, components, moments, couples, resultant force systems, free-body diagrams and planar equilibrium.

CO1 · Approx. 16 hours

Friction, Structures and Trusses

Dry friction, limiting equilibrium, ladders/wedges; pin-jointed trusses; method of joints and method of sections.

CO2 · Approx. 14 hours

Centroid and Area Moment of Inertia

Centroid, first moment of area, composite sections, second moment of area and parallel-axis principle.

CO3 · Approx. 15 hours

Motion, Work, Energy and Power

Rectilinear motion, Newton's laws, work, kinetic/potential energy, work-energy method and power.

CO4 · Approx. 15 hours

MODULE 1

Forces, Resultants and Equilibrium

Force vectors, components, moments, couples, resultant force systems, free-body diagrams and planar equilibrium.

Approx. 16 hours

CO1

Understand · Apply

Learning goals

Identify core terms, explain the principle and complete the stated application or practical outcome.

Key evidence

Use a labelled diagram, table, graph, procedure or calculation that matches the topic.

Engineering habit

Check units, polarity/direction, ratings, materials and safety before concluding.

Study flow for Forces, Resultants and Equilibrium: identify the system, state its principle, follow the correct method and verify the result safely.

1. Force vectors and resolution–

A force has magnitude, direction and line of action. In planar analysis it is resolved into perpendicular components so that each direction can be treated using signed algebra. Correct axes and direction assumptions are the foundation of every mechanics solution.

Study and application method

Draw the body first, choose axes, resolve each inclined force using sine/cosine with a labelled angle, and record signs before summing components.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Draw the body first, choose axes, resolve each inclined force using sine/cosine with a labelled angle, and record signs before summing components.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: ഏതു concept ഈ പ്രശ്നം പരിഹരിക്കാൻ ഉപയോഗിക്കണം. ഈ diagram / circuit / formula / procedure എങ്ങനെ ഉപയോഗിക്കണം. ഈ result ഈ application ഈ പ്രശ്നം പരിഹരിക്കാൻ ഉപയോഗിക്കണം. Technical terms English-ൽ എങ്ങനെ എഴുതണം.

Common mistake / precaution: Do not use sine and cosine by habit; identify which component is adjacent/opposite to the stated angle.

2. Moments, couples and resultant systems–

The moment of a force measures turning tendency about a point. A couple produces pure rotation. A distributed or multi-force system can be replaced by a resultant force and resultant moment where appropriate.

Study and application method

Mark moment centre, use perpendicular distance or vector-component approach, apply one sign convention for clockwise/counter-clockwise and state the resultant's physical meaning.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Mark moment centre, use perpendicular distance or vector-component approach, apply one sign convention for clockwise/counter-clockwise and state the resultant's physical meaning.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: concept നോക്കുക. diagram / circuit / formula / procedure നോക്കുക. result നോക്കുക. application നോക്കുക. Technical terms English-നോക്കുക.

Common mistake / precaution: A force passing through the chosen moment point produces zero moment; do not use an arbitrary distance.

3. Free-body diagrams and equilibrium–

A free-body diagram isolates the body and shows all external forces, reactions and dimensions. Static equilibrium in a plane requires zero net force in each coordinate direction and zero net moment.

Study and application method

Isolate one body, replace supports by correct reaction components, write $\Sigma F_x=0$, $\Sigma F_y=0$ and $\Sigma M=0$, then verify units and reaction directions.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Isolate one body, replace supports by correct reaction components, write $\Sigma F_x=0$, $\Sigma F_y=0$ and $\Sigma M=0$, then verify units and reaction directions.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: ഏതു concept ഈ പ്രശ്നം പരിഹരിക്കാൻ ഉപയോഗിക്കണം. ഈ diagram / circuit / formula / procedure എങ്ങനെ ഉപയോഗിക്കണം. ഈ result ഈ application ഈ പ്രശ്നം പരിഹരിക്കാൻ ഉപയോഗിക്കണം. Technical terms English-ൽ എങ്ങനെ ഉപയോഗിക്കണം.

Common mistake / precaution: Never include internal action pairs on a free-body diagram of the combined system.

Module 1 revision cue: Re-read official major topics, redraw one key diagram/flow and explain one practical or numerical method without looking at notes.

MODULE 2

Friction, Structures and Trusses

Dry friction, limiting equilibrium, ladders/wedges; pin-jointed trusses; method of joints and method of sections.

Learning goals

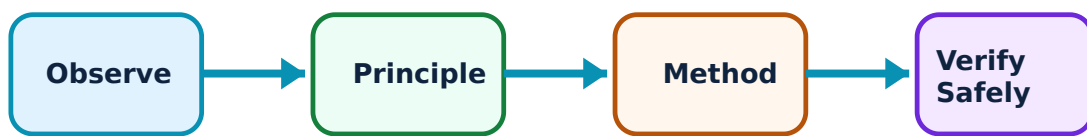

Identify core terms, explain the principle and complete the stated application or practical outcome.

Key evidence

Use a labelled diagram, table, graph, procedure or calculation that matches the topic.

Engineering habit

Check units, polarity/direction, ratings, materials and safety before concluding.

Study flow for Friction, Structures and Trusses: identify the system, state its principle, follow the correct method and verify the result safely.

1. Dry friction and limiting equilibrium–

Friction opposes impending or actual relative motion at a contact surface. At impending slip, the friction magnitude is related to normal reaction through the coefficient of friction. The assumed direction is checked by the sign of the result.

Study and application method

Draw a separate free-body diagram, identify normal reaction and likely motion, place friction opposite the likely motion, then apply equilibrium equations.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Draw a separate free-body diagram, identify normal reaction and likely motion, place friction opposite the likely motion, then apply equilibrium equations.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: ഏതു concept ഈ problem ഈ diagram / circuit / formula / procedure ഉപയോഗിക്കണം. ഈ result ഈ application ഉപയോഗിക്കണം. Technical terms English-ൽ എഴുതണം.

Common mistake / precaution: Friction is not always equal to μN ; that equality applies at limiting condition in the idealised model.

2. Simple trusses and the method of joints–

An ideal pin-jointed truss carries loads at joints and has members acting primarily in tension or compression. The method of joints applies particle equilibrium at a joint after support reactions are found.

Study and application method

Find support reactions for the whole truss, choose a joint with at most two unknown member forces, assume member forces tensile and apply $\Sigma F_x=0$ and $\Sigma F_y=0$.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions,

and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Find support reactions for the whole truss, choose a joint with at most two unknown member forces, assume member forces tensile and apply $\Sigma F_x=0$ and $\Sigma F_y=0$.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: ഏതു concept നോക്കണം. ഏതു diagram / circuit / formula / procedure ഉപയോഗിക്കണം. ഏതു result ഉപയോഗിക്കണം. Technical terms English-ൽ എങ്ങനെ എഴുതണം.

Common mistake / precaution: A negative result does not mean the calculation failed; it means the actual member sense is opposite to the assumed tensile direction.

3. Method of sections–

The method of sections is efficient when force in a particular truss member is required. A conceptual cut creates an isolated rigid body and equilibrium equations determine cut-member forces.

Study and application method

Solve external reactions if needed, cut through the target and as few other unknown members as possible, draw one section free-body diagram and use a strategic moment equation.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Solve external reactions if needed, cut through the target and as few other unknown members as possible, draw one section free-body diagram and use a strategic moment equation.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: ഏതു concept ഈ problem ഈ diagram / circuit / formula / procedure ഈ result ഈ application ഈ technical terms English-ൽ ഈ diagram ഈ circuit.

Common mistake / precaution: Include every external reaction/load and every cut-member force on the selected section.

Module 2 revision cue: Re-read official major topics, redraw one key diagram/flow and explain one practical or numerical method without looking at notes.

MODULE 3

Centroid and Area Moment of Inertia

Centroid, first moment of area, composite sections, second moment of area and parallel-axis principle.

Approx. 15 hours

CO3

Understand · Apply

Learning goals

Identify core terms, explain the principle and complete the stated application or practical outcome.

Key evidence

Use a labelled diagram, table, graph, procedure or calculation that matches the topic.

Engineering habit

Check units, polarity/direction, ratings, materials and safety before concluding.

Study flow for Centroid and Area Moment of Inertia: identify the system, state its principle, follow the correct method and verify the result safely.

1. Centroid and first moment of area–

The centroid is the geometric centre of an area. It is found from weighted area coordinates and is essential when locating a resultant or preparing section-property calculations.

Study and application method

Divide a composite shape into non-overlapping simple areas, prepare an area-coordinate table, use sign convention for cut-outs and calculate $\bar{x}$ and $\bar{y}$.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Divide a composite shape into non-overlapping simple areas, prepare an area-coordinate table, use sign convention for cut-outs and calculate $\bar{x}$ and $\bar{y}$.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: കോൺസെപ്റ്റ് വ്യക്തമായി വിശദീകരിക്കുക. സൂചിപ്പിക്കുന്ന diagram / circuit / formula / procedure വ്യക്തമായി വിശദീകരിക്കുക. ഉത്തരം result വ്യക്തമായി application വ്യക്തമായി വിശദീകരിക്കുക. Technical terms English-ൽ വ്യക്തമായി വിശദീകരിക്കുക.

Common mistake / precaution: Treat holes as negative areas and measure every coordinate from the same reference axes.

2. Second moment of area–

The second moment of area measures distribution of area relative to an axis and influences bending behaviour. It differs from mass moment of inertia, which concerns resistance to angular acceleration of a mass.

Study and application method

State the reference axis, use an appropriate standard-shape formula, preserve units of length to fourth power and identify whether the requested property is area or mass moment.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: State the reference axis, use an appropriate standard-shape formula, preserve units of length to fourth power and identify whether the requested property is area or mass moment.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: ഏതു concept ഈ problem ഈ diagram / circuit / formula / procedure ഉപയോഗിക്കണം. ഈ result ഈ application ഉപയോഗിക്കണം. Technical terms English-ൽ എഴുതണം.

Common mistake / precaution: Do not confuse centroid location with second moment of area; they answer different questions.

3. Parallel-axis principle for composite sections–

The parallel-axis principle transfers a centroidal area moment of inertia to a parallel axis using area and offset distance. It permits section-property calculation for built-up shapes.

Study and application method

Find each component centroid, calculate its offset to target axis, add $I_{\text{centroid}} + Ad^2$ for solid components and subtract for voids.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Find each component centroid, calculate its offset to target axis, add $I_{\text{centroid}} + Ad^2$ for solid components and subtract for voids.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: ഏതു concept നോക്കണം. ഏതു diagram / circuit / formula / procedure ഉപയോഗിക്കണം. ഏതു result ഉണ്ടാകും. ഏതു application ഉണ്ടാകും. Technical terms English-ൽ എങ്ങനെ എഴുതണം.

Common mistake / precaution: The offset distance must be perpendicular to the relevant axis and squared.

Module 3 revision cue: Re-read official major topics, redraw one key diagram/flow and explain one practical or numerical method without looking at notes.

MODULE 4

Motion, Work, Energy and Power

Rectilinear motion, Newton's laws, work, kinetic/potential energy, work-energy method and power.

Approx. 15 hours

CO4

Understand · Apply

Learning goals

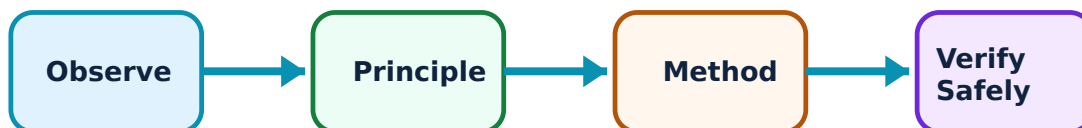

Identify core terms, explain the principle and complete the stated application or practical outcome.

Key evidence

Use a labelled diagram, table, graph, procedure or calculation that matches the topic.

Engineering habit

Check units, polarity/direction, ratings, materials and safety before concluding.

Study flow for Motion, Work, Energy and Power: identify the system, state its principle, follow the correct method and verify the result safely.

1. Rectilinear motion and Newton's laws–

Displacement, velocity and acceleration describe motion along a line. Newton's laws connect force and acceleration and require a correctly isolated body with consistent units.

Study and application method

List known kinematic quantities, choose a constant-acceleration relation only when justified, draw a free-body diagram for force analysis and state direction convention.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: List known kinematic quantities, choose a constant-acceleration relation only when justified, draw a free-body diagram for force analysis and state direction convention.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: ഏതു concept ഈ problem ഈ diagram / circuit / formula / procedure ഉപയോഗിക്കണം. ഈ diagram / circuit / formula / procedure result application ഉപയോഗിക്കണം. Technical terms English-ൽ എഴുതണം.

Common mistake / precaution: Do not mix velocity and acceleration units or use constant-acceleration equations when acceleration is not constant.

2. Work and energy–

Work is force component along displacement multiplied by displacement. Kinetic energy depends on speed and mass; potential energy reflects position in a conservative field. Work-energy relates net work to kinetic-energy change.

Study and application method

Define system and initial/final states, identify force components along motion, write work contributions with sign, then apply energy relation with units.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Define system and initial/final states, identify force components along motion, write work contributions with sign, then apply energy relation with units.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: ഏതു concept നോക്കണം. ഏതു diagram / circuit / formula / procedure ഉപയോഗിക്കണം. ഏതു result application ഉപയോഗിക്കണം. Technical terms English-ൽ എങ്ങനെ എഴുതണം.

Common mistake / precaution: Only the component of a force along displacement performs the corresponding scalar work.

3. Power and engineering interpretation–

Power is rate of doing work or transferring energy. It helps relate force, speed and machine capacity and supports comparison of operating conditions.

Study and application method

Write required units, use $P=W/t$ or instantaneous force-velocity relation only when direction assumptions are clear, then comment on practical meaning.

Connect the explanation to the official student learning outcome before attempting a numerical, diagram, procedure or viva answer.

Evidence of understanding

Use correct terminology, a labelled sketch/table where useful, correct units or conditions, and a conclusion linked to the observed or calculated result.

How to construct a complete answer

Given: identify the quantities, device condition, waveform or circuit arrangement.

Required: state exactly what must be found or explained.

Method: Write required units, use $P=W/t$ or instantaneous force-velocity relation only when direction assumptions are clear, then comment on practical meaning.

Answer habit: show a labelled step, the relevant unit/condition and a short interpretation.

Malayalam support: കണ്ടെത്തേണ്ട concept നൽകിയിരിക്കുന്നു. നൽകിയിരിക്കുന്ന diagram / circuit / formula / procedure ഉപയോഗിച്ച് പരിഹരിക്കുക. ഉപയോഗിക്കേണ്ട result നൽകിയിരിക്കുന്നു application നൽകിയിരിക്കുന്നു. Technical terms English-ൽ നൽകിയിരിക്കുന്നു.

Common mistake / precaution: Do not report energy units as power units; joule and watt represent different quantities.

Module 4 revision cue: Re-read official major topics, redraw one key diagram/flow and explain one practical or numerical method without looking at notes.

FORMULA AND PROCEDURE BANK

Rapid Recall Bank

Recall 1

State symbols and SI units before substitution.

Recall 2

Draw the circuit, system boundary, vector or process flow before reasoning.

Recall 3

For laboratory work: aim → apparatus → diagram → procedure → observation → calculation → result → precautions.

Recall 4

For a graph: label axes, units, scale, operating region and conclusion.

Recall 5

For a comparison: use construction, working, result, advantage and limitation.

Recall 6

For an extended answer: definition/principle, labelled diagram, working steps, application and a caution/limitation.

DIAGRAM LIBRARY

Diagram Library for Rapid Revision

Module 1: Forces, Resultants and Equilibrium

Use the concept flow to revise observation, principle, method and verification.

Module 2: Friction, Structures and Trusses

Use the concept flow to revise observation, principle, method and verification.

Module 3: Centroid and Area Moment of Inertia

Use the concept flow to revise observation, principle, method and verification.

Module 4: Motion, Work, Energy and Power

Use the concept flow to revise observation, principle, method and verification.

SELF-LEARNING

Official Self-Learning and Student Activities

Structured activity

Build free-body diagrams for a beam, ladder and simple support problem; check each force/reaction direction.

Keep evidence in your record: date, source/observation, diagram/table, key learning and questions for discussion.

Structured activity

Solve a friction and a truss problem using both a labelled diagram and a written equilibrium check.

Keep evidence in your record: date, source/observation, diagram/table, key learning and questions for discussion.

Structured activity

Prepare a centroid/second-moment table for a composite structural section with a cut-out.

Keep evidence in your record: date, source/observation, diagram/table, key learning and questions for discussion.

Structured activity

Compare motion equations and the work-energy method for an engineering example, including units and a final interpretation.

Keep evidence in your record: date, source/observation, diagram/table, key learning and questions for discussion.

Activity discipline: The supplied PDF assigns the listed self-learning hours. This handbook preserves the activity direction; the teacher's approved schedule and safety instructions govern

EXAMINATION READINESS

Assessment Methodology and Examination Pattern

Official assessment structure

Component	Official mark / conversion	Student evidence
Attendance	5 marks	End-of-semester attendance component.
Self-learning activities	15 marks	Module-linked activities.
Series examinations	20 + 20 converted	Two 50-mark series examinations.
CIE total	Theory CIE 40	Continuous internal evaluation.
Written ESE	Theory ESE 60	2.5 hours; official Part A / Part B / Part C pattern.

Series-test pattern

The supplied theory pattern uses Part A (1-mark), Part B (3-mark with choice) and Part C (7-mark) distribution across the stated modules. Practical courses follow the supplied practical-test scheme.

Examination evidence

Show a complete method, correct units/conditions, clear diagrams or tables, a result/conclusion and safety awareness for any apparatus or process involved.

EXAM PRACTICE

Module-wise Questions with Answers

Module 1 — Forces, Resultants and Equilibrium

Explain Force vectors and resolution and state one correct method, application or precaution.—

A force has magnitude, direction and line of action. In planar analysis it is resolved into perpendicular components so that each direction can be treated using signed algebra. Correct axes and direction assumptions are the foundation of every mechanics solution.

Answer framework: Draw the body first, choose axes, resolve each inclined force using sine/cosine with a labelled angle, and record signs before summing components.

Important point: Do not use sine and cosine by habit; identify which component is adjacent/opposite to the stated angle.

Explain Moments, couples and resultant systems and state one correct method, application or precaution. –

The moment of a force measures turning tendency about a point. A couple produces pure rotation. A distributed or multi-force system can be replaced by a resultant force and resultant moment where appropriate.

Answer framework: Mark moment centre, use perpendicular distance or vector-component approach, apply one sign convention for clockwise/counter-clockwise and state the resultant's physical meaning.

Important point: A force passing through the chosen moment point produces zero moment; do not use an arbitrary distance.

Explain Free-body diagrams and equilibrium and state one correct method, application or precaution. –

A free-body diagram isolates the body and shows all external forces, reactions and dimensions. Static equilibrium in a plane requires zero net force in each coordinate direction and zero net moment.

Answer framework: Isolate one body, replace supports by correct reaction components, write $\Sigma F_x=0$, $\Sigma F_y=0$ and $\Sigma M=0$, then verify units and reaction directions.

Important point: Never include internal action pairs on a free-body diagram of the combined system.

Module 2 — Friction, Structures and Trusses

Explain Dry friction and limiting equilibrium and state one correct method, application or precaution. –

Friction opposes impending or actual relative motion at a contact surface. At impending slip, the friction magnitude is related to normal reaction through the coefficient of friction. The assumed direction is checked by the sign of the result.

Answer framework: Draw a separate free-body diagram, identify normal reaction and likely motion, place friction opposite the likely motion, then apply equilibrium equations.

Important point: Friction is not always equal to μN ; that equality applies at limiting condition in the idealised model.

Explain Simple trusses and the method of joints and state one correct method, application or precaution. –

An ideal pin-jointed truss carries loads at joints and has members acting primarily in tension or compression. The method of joints applies particle equilibrium at a joint after support reactions are found.

Answer framework: Find support reactions for the whole truss, choose a joint with at most two unknown member forces, assume member forces tensile and apply $\Sigma F_x = 0$ and $\Sigma F_y = 0$.

Important point: A negative result does not mean the calculation failed; it means the actual member sense is opposite to the assumed tensile direction.

Explain Method of sections and state one correct method, application or precaution. –

The method of sections is efficient when force in a particular truss member is required. A conceptual cut creates an isolated rigid body and equilibrium equations determine cut-member forces.

Answer framework: Solve external reactions if needed, cut through the target and as few other unknown members as possible, draw one section free-body diagram and use a strategic moment equation.

Important point: Include every external reaction/load and every cut-member force on the selected section.

Module 3 — Centroid and Area Moment of Inertia

Explain Centroid and first moment of area and state one correct method, application or precaution. –

The centroid is the geometric centre of an area. It is found from weighted area coordinates and is essential when locating a resultant or preparing section-property calculations.

Answer framework: Divide a composite shape into non-overlapping simple areas, prepare an area-coordinate table, use sign convention for cut-outs and calculate $\bar{x}$ and $\bar{y}$.

Important point: Treat holes as negative areas and measure every coordinate from the same reference axes.

Explain Second moment of area and state one correct method, application or precaution. –

The second moment of area measures distribution of area relative to an axis and influences bending behaviour. It differs from mass moment of inertia, which concerns resistance to angular acceleration of a mass.

Answer framework: State the reference axis, use an appropriate standard-shape formula, preserve units of length to fourth power and identify whether the requested property is area or mass moment.

Important point: Do not confuse centroid location with second moment of area; they answer different questions.

Explain Parallel-axis principle for composite sections and state one correct method, application or precaution. –

The parallel-axis principle transfers a centroidal area moment of inertia to a parallel axis using area and offset distance. It permits section-property calculation for built-up shapes.

Answer framework: Find each component centroid, calculate its offset to target axis, add $I_{\text{centroid}} + Ad^2$ for solid components and subtract for voids.

Important point: The offset distance must be perpendicular to the relevant axis and squared.

Module 4 — Motion, Work, Energy and Power

Explain Rectilinear motion and Newton's laws and state one correct method, application or precaution. –

Displacement, velocity and acceleration describe motion along a line. Newton's laws connect force and acceleration and require a correctly isolated body with consistent units.

Answer framework: List known kinematic quantities, choose a constant-acceleration relation only when justified, draw a free-body diagram for force analysis and state direction convention.

Important point: Do not mix velocity and acceleration units or use constant-acceleration equations when acceleration is not constant.

Explain Work and energy and state one correct method, application or precaution. –

Work is force component along displacement multiplied by displacement. Kinetic energy depends on speed and mass; potential energy reflects position in a conservative field. Work-energy relates

net work to kinetic-energy change.

Answer framework: Define system and initial/final states, identify force components along motion, write work contributions with sign, then apply energy relation with units.

Important point: Only the component of a force along displacement performs the corresponding scalar work.

Explain Power and engineering interpretation and state one correct method, application or precaution. –

Power is rate of doing work or transferring energy. It helps relate force, speed and machine capacity and supports comparison of operating conditions.

Answer framework: Write required units, use $P=W/t$ or instantaneous force–velocity relation only when direction assumptions are clear, then comment on practical meaning.

Important point: Do not report energy units as power units; joule and watt represent different quantities.

PRACTICE ONLY

Practice Model Paper

Important: This practice paper is based on the official pattern in the supplied syllabus. It is **not** an official SITTTTR model question paper.

Part A — short response

1. State one key definition from Module 1: Forces, Resultants and Equilibrium.
2. Identify one diagram, observation, formula or safety condition relevant to Module 1.
3. State one key definition from Module 2: Friction, Structures and Trusses.
4. Identify one diagram, observation, formula or safety condition relevant to Module 2.
5. State one key definition from Module 3: Centroid and Area Moment of Inertia.
6. Identify one diagram, observation, formula or safety condition relevant to Module 3.
7. State one key definition from Module 4: Motion, Work, Energy and Power.
8. Identify one diagram, observation, formula or safety condition relevant to Module 4.

Part B — structured explanation

1. Explain a selected procedure/principle from Module 1 with a labelled diagram, table or method.
2. Explain a selected procedure/principle from Module 2 with a labelled diagram, table or method.
3. Explain a selected procedure/principle from Module 3 with a labelled diagram, table or method.

4. Explain a selected procedure/principle from Module 4 with a labelled diagram, table or method.

Part C — extended response / practical task

1. Develop a complete answer or practical plan for: Force vectors, components, moments, couples, resultant force systems, free-body diagrams and planar equilibrium..
2. Develop a complete answer or practical plan for: Dry friction, limiting equilibrium, ladders/wedges; pin-jointed trusses; method of joints and method of sections..
3. Develop a complete answer or practical plan for: Centroid, first moment of area, composite sections, second moment of area and parallel-axis principle..
4. Develop a complete answer or practical plan for: Rectilinear motion, Newton's laws, work, kinetic/potential energy, work-energy method and power..

LAST-MILE REVISION

Quick Revision

Module 1: Forces, Resultants and Equilibrium

Force vectors, components, moments, couples, resultant force systems, free-body diagrams and planar equilibrium.

- Match each topic to CO1.
- Redraw or rehearse one key method.
- Check one common mistake/precaution.

Module 2: Friction, Structures and Trusses

Dry friction, limiting equilibrium, ladders/wedges; pin-jointed trusses; method of joints and method of sections.

- Match each topic to CO2.
- Redraw or rehearse one key method.
- Check one common mistake/precaution.

Module 3: Centroid and Area Moment of Inertia

Centroid, first moment of area, composite sections, second moment of area and parallel-axis principle.

- Match each topic to CO3.
- Redraw or rehearse one key method.
- Check one common mistake/precaution.

Module 4: Motion, Work, Energy and Power

Rectilinear motion, Newton's laws, work, kinetic/potential energy, work-energy method and power.

- Match each topic to CO4.
- Redraw or rehearse one key method.
- Check one common mistake/precaution.

Common mistakes: Writing an unlabelled diagram; ignoring units, polarity or conditions; treating a practical result as valid without observations; confusing a definition with an application; and omitting a safety precaution where the topic uses apparatus, current, heat, chemicals or tools.

Exam checklist: Read the command word; answer every part; draw clean labelled diagrams; use a clear calculation/procedure; state result with units or observation; and reserve two minutes for checking.

VOCABULARY

Glossary

Important terms from the syllabus

Term / topic	One-line meaning
Force vectors and resolution	A force has magnitude, direction and line of action.
Moments, couples and resultant systems	The moment of a force measures turning tendency about a point.
Free-body diagrams and equilibrium	A free-body diagram isolates the body and shows all external forces, reactions and dimensions.
Dry friction and limiting equilibrium	Friction opposes impending or actual relative motion at a contact surface.
Simple trusses and the method of joints	An ideal pin-jointed truss carries loads at joints and has members acting primarily in tension or compression.
Method of sections	The method of sections is efficient when force in a particular truss member is required.
Centroid and first moment of area	The centroid is the geometric centre of an area.
Second moment of area	The second moment of area measures distribution of area relative to an axis and influences bending behaviour.
Parallel-axis principle for composite sections	The parallel-axis principle transfers a centroidal area moment of inertia to a parallel axis using area and offset distance.
Rectilinear motion and Newton's laws	Displacement, velocity and acceleration describe motion along a line.
Work and energy	Work is force component along displacement multiplied by displacement.
Power and engineering interpretation	Power is rate of doing work or transferring energy.
