## Official Source Declaration

This lesson uses the supplied official syllabus PDF as the authoritative source for course information, revision, modules, topics, objectives, Course Outcomes, assessment information, official activities, practical requirements, and references.

**Source handling:** Official wording and numerical values are retained wherever supplied. Educational explanations, Malayalam support, examples, diagrams, and revision questions are added as study support and are not presented as additional official requirements.

**Transparency note:** Official assessment information is reproduced below from the supplied syllabus. Any limitation in the supplied PDF is not silently corrected.

## How to Study This Lesson

### Recommended sequence

1. Begin with the official source declaration and course dashboard.
2. Study each module in the official order and keep the coverage table as a checklist.
3. Open every topic, understand the example or procedure, and write your own short answer.
4. Use the revision section, glossary, questions, and practice paper after completing the modules.

**Study principle:** Keep English technical terminology, symbols, units, and official assessment wording unchanged in examination answers. Use the Malayalam support blocks only as a bridge to understanding.

**Handbook method:** Do not treat a topic as completed after reading its heading. For every topic card, complete the learning objectives, follow the conceptual framework, write the worked answer method, and answer the self-check questions. This creates a study record that is useful for class learning and examination preparation.

### Prerequisites

- Basic knowledge in Tally — Computerized Financial Accounting-I, Semester 5.

### How to study this lesson

1. Read the module introduction and learning goals.
2. Open every topic and reproduce its example, sequence, or procedure.
3. Use Malayalam support as a bridge; retain English technical terms for examinations.
4. Attempt the module questions without looking at the answers.

## Objectives, Course Outcomes and CO-PO Information

### Official course objectives

1. To provide hands-on experience in Computerized Financial Accounting using Tally.
2. To familiarize students with bank reconciliation statement, goods and service tax, tax deducted at source and payroll processing in Tally software.

### Course Outcomes

1. Construct bank reconciliation statement in Tally.
2. Solve problems of duties and taxes and Goods and Service Tax.
3. Construct payroll statement.
4. Make use of tax deducted at source, stock and pricing.

## CO-PO mapping as supplied

CO1→PO2=3; CO2→PO3=3; CO3→PO2=3 and PO4=3; CO4→PO1=3.

Legend: 3-Strongly mapped, 2-Moderately mapped, 1-Weakly mapped.

## Complete Syllabus Coverage

### Official syllabus point-by-point coverage

This audit layer maps every official source block to the corresponding lesson module. The source transcript is retained verbatim as extracted from the supplied syllabus; the study guidance below is educational support and is not presented as additional official syllabus content. No official point is intentionally omitted.

### OFFICIAL MODULE 1

## Bank reconciliation and company data management

This module uses Tally to reconcile bank-book entries, investigate differences and protect company data.

**Hours: 10**

**CO1 · Bloom level: Applying**

**Handbook study routine:** Complete Module 1 in three passes. First read the official source coverage and topic headings. Next study every Handbook treatment, writing the key definition, relationship, procedure, formula, diagram, or comparison in your own words.

Finally close the notes and answer the self-check questions and the module questions without looking at the answer.

## Official source coverage for Module 1

Source basis: Official Contents block. Every point below is retained and linked to a study-oriented explanation. The main topic cards remain the primary lesson narrative.

## Point-by-point study guide

## – Official syllabus point 1: Bank reconciliation statement

### Exact source point

**Syllabus text:** Bank reconciliation statement

### How to understand and study it

This point is an official syllabus requirement: “Bank reconciliation statement”. Treat every named term as an examinable subpoint. Define it, explain its role or behaviour, distinguish it from related terms, and connect it to the module application. The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

1. Write the exact technical term and a one-sentence definition in your own words.
2. List the named terms separately and add one distinguishing feature or engineering use for each.
3. Finish with one examination answer: definition, explanation, diagram/table if relevant, and application or limitation.

**Malayalam support:** ് syllabus point ് Bank reconciliation statement ് technical terms English-്. ് definition ് principle ്; ് term-് function, difference, application ്. Diagram, sequence, formula, unit ്. ് revision ്.

**Exam focus:** Answer this point with its definition or principle first, followed by the named features, sequence, comparison, formula, diagram, or application that the question demands.

# Handbook treatment

Bank reconciliation statement is an official examinable part of the module. Study it as a connected explanation: define the central term, identify the related elements, explain their relationship, and finish with a relevant engineering use or limitation.

## Learning objectives

- Define and scope Bank reconciliation statement using the official terminology retained above.
- Organise the important elements of Bank reconciliation statement into a logical sequence, classification, structure, or calculation.
- Connect Bank reconciliation statement with one engineering decision, operation, measurement, or safety requirement in the context of Bank reconciliation and company data management.
- Write an examination answer on Bank reconciliation statement with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading Bank reconciliation statement. It is a study organisation method, not an additional official syllabus requirement.

- Start with the exact technical term and its scope.
- Separate the topic into named elements, stages, types, or conditions.
- Explain the relationship using cause-and-effect, sequence, comparison, or a labelled representation.
- Apply the idea to a realistic engineering situation and state one limitation or common mistake.

## Engineering application lens

The engineering value of Bank reconciliation statement is understood by asking what requirement it satisfies, what input or condition it depends on, how the output is obtained, and how a technician or designer verifies the result. Use the module context to make the application specific rather than memorising an isolated definition.

## Worked answer method

**Given:** the topic, operating condition, diagram, data, or situation stated in the question.

**Required:** definition, explanation, comparison, procedure, calculation, or application as requested.

**Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

### Exam answer blueprint

For a short-answer question on Bank reconciliation statement, begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

- What is Bank reconciliation statement, and what is its scope in this module?
- Which elements, stages, types, quantities, or conditions must be named when explaining Bank reconciliation statement?
- How would you distinguish Bank reconciliation statement from a closely related idea?
- Where would an engineer or technician encounter Bank reconciliation statement, and what must be checked before using it?
- What common mistake would make an answer or operation involving Bank reconciliation statement incorrect?

### Common mistakes and safety emphasis

- Copying a definition without explaining the mechanism or purpose.
- Listing terms without showing their relationship.
- Using an example that does not match the stated topic or condition.
- Leaving out a diagram, unit, assumption, limitation, or safety point when the question requires it.

## – Official syllabus point 2: computation

### Exact source point

**Syllabus text:** computation

### How to understand and study it

This point is an official syllabus requirement: “computation”. Treat every named term as an examinable subpoint. Define it, explain its role or behaviour, distinguish it from related terms, and connect it to the module application. The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

- Connect computation with one engineering decision, operation, measurement, or safety requirement in the context of Bank reconciliation and company data management.
- Write an examination answer on computation with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading computation. It is a study organisation method, not an additional official syllabus requirement.

- Start with the exact technical term and its scope.
- Separate the topic into named elements, stages, types, or conditions.
- Explain the relationship using cause-and-effect, sequence, comparison, or a labelled representation.
- Apply the idea to a realistic engineering situation and state one limitation or common mistake.

The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

1. Write the exact technical term and a one-sentence definition in your own words.
2. List the named terms separately and add one distinguishing feature or engineering use for each.
3. Finish with one examination answer: definition, explanation, diagram/table if relevant, and application or limitation.

**Malayalam support:** ് syllabus point ് settings ് technical terms English-്. ് definition ് principle ്; ് term-് function, difference, application ്. Diagram, sequence, formula, unit ് ് revision ്.

**Exam focus:** Answer this point with its definition or principle first, followed by the named features, sequence, comparison, formula, diagram, or application that the question demands.

# Handbook treatment

settings is an official examinable part of the module. Study it as a connected explanation: define the central term, identify the related elements, explain their relationship, and finish with a relevant engineering use or limitation.

## Learning objectives

- Define and scope settings using the official terminology retained above.
- Organise the important elements of settings into a logical sequence, classification, structure, or calculation.
- Connect settings with one engineering decision, operation, measurement, or safety requirement in the context of Bank reconciliation and company data management.
- Write an examination answer on settings with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading settings. It is a study organisation method, not an additional official syllabus requirement.

- Start with the exact technical term and its scope.
- Separate the topic into named elements, stages, types, or conditions.
- Explain the relationship using cause-and-effect, sequence, comparison, or a labelled representation.
- Apply the idea to a realistic engineering situation and state one limitation or common mistake.

## Engineering application lens

The engineering value of settings is understood by asking what requirement it satisfies, what input or condition it depends on, how the output is obtained, and how a technician or designer verifies the result. Use the module context to make the application specific rather than memorising an isolated definition.

## Worked answer method

**Given:** the topic, operating condition, diagram, data, or situation stated in the question.

**Required:** definition, explanation, comparison, procedure, calculation, or application as requested.

**Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

### Exam answer blueprint

For a short-answer question on settings, begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

- What is settings, and what is its scope in this module?
- Which elements, stages, types, quantities, or conditions must be named when explaining settings?
- How would you distinguish settings from a closely related idea?
- Where would an engineer or technician encounter settings, and what must be checked before using it?
- What common mistake would make an answer or operation involving settings incorrect?

### Common mistakes and safety emphasis

- Copying a definition without explaining the mechanism or purpose.
- Listing terms without showing their relationship.
- Using an example that does not match the stated topic or condition.
- Leaving out a diagram, unit, assumption, limitation, or safety point when the question requires it.

### Module study tip

Read every topic in sequence, reproduce its example or procedure, and write a short explanation before attempting the module questions.

Learning map for Module module-1: the listed topics build the module competency.

### Concept and explanation

**Official scope.** The syllabus specifies **Bank reconciliation statement and Tally audit features**. The corresponding study scope is: Interpret bank reconciliation statement and Tally audit features; understand buttons, computation and bank-book balance.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

| Aspect                 | Expected learning                                                                                                                                                                        |

| Application            | Bank reconciliation statement and Tally audit features is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis. |

**Technical treatment.** Use the official scope as a checklist. Relate each item to the neighbouring topics in the module, and distinguish normal operation from a fault, limitation, or incorrect assumption. In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

**Malayalam support:** Malayalam support: Bank reconciliation statement and Tally audit features എന്നു് topic ന്നു് പരിചയപ്പെടുത്തുക. എന്നു് meaning ന്നു് purpose ന്നു്. എന്നു് എന്നു് steps, components ന്നു് variables, എന്നു് application, limitation, safety check എന്നു് എന്നു് എന്നു്. ### Study points

- Define Bank reconciliation statement and Tally audit features using the official syllabus wording.
- Explain the sequence, relationship, calculation, or document procedure before listing details.
- Use a labelled diagram, table, formula, unit, or operating condition wherever it improves the answer.
- Connect the topic to an appropriate application and state one limitation, verification point, or common error.

**Engineering / workplace application:** Bank reconciliation statement and Tally audit features is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis.

**Illustrative example:** Revision task: Prepare a four-column note for Bank reconciliation statement and Tally audit features under the headings purpose, principle/procedure, important parameters, and application/limitation. Check every term in the official scope before moving to the next topic.

**Common mistake:** A common mistake is to reproduce isolated points for Bank reconciliation statement and Tally audit features without explaining their order, purpose, or engineering consequence.

# Handbook treatment

M1.01 — Bank reconciliation statement and Tally audit features (2 hours) is an official examinable part of the module. Study it as a connected explanation: define the central term, identify the related elements, explain their relationship, and finish with a relevant engineering use or limitation.

### Study points

- Define Company backup and restore functions using the official syllabus wording.
- Explain the sequence, relationship, calculation, or document procedure before listing details.
- Use a labelled diagram, table, formula, unit, or operating condition wherever it improves the answer.
- Connect the topic to an appropriate application and state one limitation, verification point, or common error.

**Engineering / workplace application:** Company backup and restore functions is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis.

**Illustrative example:** Revision task: Prepare a four-column note for Company backup and restore functions under the headings purpose, principle/procedure, important parameters, and application/limitation. Check every term in the official scope before moving to the next topic.

**Common mistake:** A common mistake is to reproduce isolated points for Company backup and restore functions without explaining their order, purpose, or engineering consequence.

# Handbook treatment

M1.03 — Company backup and restore functions (3 hours) is an official examinable part of the module. Study it as a connected explanation: define the central term, identify the related elements, explain their relationship, and finish with a relevant engineering use or limitation.

## Learning objectives

- Define and scope M1.03 — Company backup and restore functions (3 hours) using the official terminology retained above.
- Organise the important elements of M1.03 — Company backup and restore functions (3 hours) into a logical sequence, classification, structure, or calculation.
- Connect M1.03 — Company backup and restore functions (3 hours) with one engineering decision, operation, measurement, or safety requirement in the context of Bank reconciliation and company data management.
- Write an examination answer on M1.03 — Company backup and restore functions (3 hours) with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading M1.03 — Company backup and restore functions (3 hours). It is a study organisation method, not an additional official syllabus requirement.

- Start with the exact technical term and its scope.
- Separate the topic into named elements, stages, types, or conditions.
- Explain the relationship using cause-and-effect, sequence, comparison, or a labelled representation.
- Apply the idea to a realistic engineering situation and state one limitation or common mistake.

## Engineering application lens

The engineering value of M1.03 — Company backup and restore functions (3 hours) is understood by asking what requirement it satisfies, what input or condition it depends on, how the output is obtained, and how a technician or designer verifies the result. Use the module context to make the application specific rather than memorising an isolated definition.

## Worked answer method

**Given:** the topic, operating condition, diagram, data, or situation stated in the question.

**Required:** definition, explanation, comparison, procedure, calculation, or application as requested.

**Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

### Exam answer blueprint

For a short-answer question on M1.03 — Company backup and restore functions (3 hours), begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

- What is M1.03 — Company backup and restore functions (3 hours), and what is its scope in this module?
- Which elements, stages, types, quantities, or conditions must be named when explaining M1.03 — Company backup and restore functions (3 hours)?
- How would you distinguish M1.03 — Company backup and restore functions (3 hours) from a closely related idea?
- Where would an engineer or technician encounter M1.03 — Company backup and restore functions (3 hours), and what must be checked before using it?
- What common mistake would make an answer or operation involving M1.03 — Company backup and restore functions (3 hours) incorrect?

### Common mistakes and safety emphasis

- Copying a definition without explaining the mechanism or purpose.
- Listing terms without showing their relationship.
- Using an example that does not match the stated topic or condition.
- Leaving out a diagram, unit, assumption, limitation, or safety point when the question requires it.

## OFFICIAL MODULE 2

# Duties, taxes and GST

This module introduces indirect taxation concepts and their operational treatment in Tally.

**Hours: 14**

**CO2 • Bloom level: Applying**

**Handbook study routine:** Complete Module 2 in three passes. First read the official source coverage and topic headings. Next study every Handbook treatment, writing the key definition, relationship, procedure, formula, diagram, or comparison in your own words. Finally close the notes and answer the self-check questions and the module questions without looking at the answer.

## Official source coverage for Module 2

## Point-by-point study guide

## – Official syllabus point 1: Duties and taxes

### Exact source point

**Syllabus text:** Duties and taxes

### How to understand and study it

This point is an official syllabus requirement: “Duties and taxes”. Treat every named term as an examinable subpoint. Define it, explain its role or behaviour, distinguish it from related terms, and connect it to the module application. The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

1. Write the exact technical term and a one-sentence definition in your own words.
2. List the named terms separately and add one distinguishing feature or engineering use for each.
3. Finish with one examination answer: definition, explanation, diagram/table if relevant, and application or limitation.

**Malayalam support:** ് syllabus point ് Duties ് technical terms English-്. ് definition ് principle ്; ് term-് function, difference, application ്. Diagram, sequence, formula, unit ് revision ്.

**Exam focus:** Answer this point with its definition or principle first, followed by the named features, sequence, comparison, formula, diagram, or application that the question demands.

# Handbook treatment

Structure of GST – CGST, SGST, UTGST & IGST -GSTN should be studied by linking structure, property, process, and application. The important question is why a material or process gives a particular behaviour and where that behaviour is useful or limiting.

## Learning objectives

- Define and scope Structure of GST – CGST, SGST, UTGST & IGST -GSTN using the official terminology retained above.
- Organise the important elements of Structure of GST – CGST, SGST, UTGST & IGST -GSTN into a logical sequence, classification, structure, or calculation.
- Connect Structure of GST – CGST, SGST, UTGST & IGST -GSTN with one engineering decision, operation, measurement, or safety requirement in the context of Duties, taxes and GST.
- Write an examination answer on Structure of GST – CGST, SGST, UTGST & IGST -GSTN with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading Structure of GST – CGST, SGST, UTGST & IGST -GSTN. It is a study organisation method, not an additional official syllabus requirement.

- Identify the material, process, property, or defect named in the topic.
- Explain the relevant structure or mechanism at the level expected in the syllabus.
- Relate the mechanism to strength, hardness, conductivity, corrosion, manufacturability, durability, or another stated property.
- Finish with selection criteria, application, limitation, and safety or quality consideration.

## Engineering application lens

In engineering practice, Structure of GST – CGST, SGST, UTGST & IGST -GSTN affects selection, manufacturing quality, service life, inspection, and maintenance. A technically useful answer links the observed property or defect to its cause and then to the method used to control or exploit it.

## Worked answer method

**Given:** the material, process, property, or service condition in the question.

**Required:** explanation, comparison, selection, or identification of the relevant mechanism.

**Method:** state the principle; connect cause to property; compare alternatives using the same criteria; mention the relevant test or control.

**Answer:** give the conclusion with the application and the principal limitation.

## – Official syllabus point 5: HSN Code - SAC code- Scope of Supply -Time and value of supply of goods

### Exact source point

**Syllabus text:** HSN Code - SAC code- Scope of Supply -Time and value of supply of goods

### How to understand and study it

This point is an official syllabus requirement: “HSN Code - SAC code- Scope of Supply - Time and value of supply of goods”. Record the relevant quantity, symbol, unit, relation or formula, and the interpretation of the result. Do not memorise a number without its unit and condition. The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

1. Write the exact technical term and a one-sentence definition in your own words.
2. Practise one small input-output example and test at least one boundary or fault condition.
3. Finish with one examination answer: definition, explanation, diagram/table if relevant, and application or limitation.

**Malayalam support:** ് syllabus point ് HSN Code - SAC code- Scope of Supply -Time, value of supply of goods ് technical terms English- ്. ് definition ് principle ്; ് ് term-് function, difference, application ്. Diagram, sequence, formula, unit ് revision ്.

**Exam focus:** Answer this point with its definition or principle first, followed by the named features, sequence, comparison, formula, diagram, or application that the question demands.

# Handbook treatment

HSN Code – SAC code- Scope of Supply -Time and value of supply of goods must be learned as both a concept and a calculation procedure. The student should know what each quantity represents, the conditions under which a relation is valid, the unit of every quantity, and how to check whether the final answer is physically reasonable.

## Learning objectives

- Define and scope HSN Code – SAC code- Scope of Supply -Time and value of supply of goods using the official terminology retained above.
- Organise the important elements of HSN Code – SAC code- Scope of Supply - Time and value of supply of goods into a logical sequence, classification, structure, or calculation.
- Connect HSN Code – SAC code- Scope of Supply -Time and value of supply of goods with one engineering decision, operation, measurement, or safety requirement in the context of Duties, taxes and GST.
- Write an examination answer on HSN Code – SAC code- Scope of Supply -Time and value of supply of goods with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading HSN Code – SAC code- Scope of Supply - Time and value of supply of goods. It is a study organisation method, not an additional official syllabus requirement.

- Identify the given quantities and write them with symbols and SI units.
- Select the governing definition, equation, graph, or relationship instead of starting with arithmetic.
- Substitute values only after checking units and the stated operating condition.
- Interpret the result in words and check its sign, magnitude, unit, and limiting behaviour.

## Engineering application lens

In an engineering setting, HSN Code – SAC code- Scope of Supply -Time and value of supply of goods is useful when a designer or technician must convert an observation into a measurable value, predict a response, compare alternatives, or verify that a component is operating within its rated condition. The practical question is always: what is measured or known, what is required, what model is appropriate, and how will the result be checked?

## Worked answer method

**Given:** the quantities and conditions stated in the question.

**Required:** the unknown quantity, including its unit.

**Calculation:** write the governing relation symbolically, substitute consistently converted values, and show the unit cancellation.

**Answer:** report the result with a suitable number of significant figures and one sentence of interpretation.

### Exam answer blueprint

For a short-answer question on HSN Code – SAC code- Scope of Supply - Time and value of supply of goods, begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

## — Official syllabus point 6: Time of supply of services- Place of supply

### Exact source point

**Syllabus text:** Time of supply of services- Place of supply

### How to understand and study it

This point is an official syllabus requirement: “Time of supply of services- Place of supply”. Treat every named term as an examinable subpoint. Define it, explain its role or behaviour, distinguish it from related terms, and connect it to the module application. The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

1. Write the exact technical term and a one-sentence definition in your own words.
2. List the named terms separately and add one distinguishing feature or engineering use for each.
3. Finish with one examination answer: definition, explanation, diagram/table if relevant, and application or limitation.

**Malayalam support:** ് syllabus point ് Time of supply of services- Place of supply ് technical terms English-്. ് definition ് principle ്; ് term-് function, difference, application ്. Diagram, sequence, formula, unit ്. ് revision ്.

**Exam focus:** Answer this point with its definition or principle first, followed by the named features, sequence, comparison, formula, diagram, or application that the question demands.

# Handbook treatment

Time of supply of services- Place of supply is an official examinable part of the module. Study it as a connected explanation: define the central term, identify the related elements, explain their relationship, and finish with a relevant engineering use or limitation.

## Learning objectives

- Define and scope Time of supply of services- Place of supply using the official terminology retained above.
- Organise the important elements of Time of supply of services- Place of supply into a logical sequence, classification, structure, or calculation.
- Connect Time of supply of services- Place of supply with one engineering decision, operation, measurement, or safety requirement in the context of Duties, taxes and GST.
- Write an examination answer on Time of supply of services- Place of supply with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading Time of supply of services- Place of supply. It is a study organisation method, not an additional official syllabus requirement.

- Start with the exact technical term and its scope.
- Separate the topic into named elements, stages, types, or conditions.
- Explain the relationship using cause-and-effect, sequence, comparison, or a labelled representation.
- Apply the idea to a realistic engineering situation and state one limitation or common mistake.

## Engineering application lens

The engineering value of Time of supply of services- Place of supply is understood by asking what requirement it satisfies, what input or condition it depends on, how the output is obtained, and how a technician or designer verifies the result. Use the module context to make the application specific rather than memorising an isolated definition.

## Worked answer method

**Given:** the topic, operating condition, diagram, data, or situation stated in the question.

**Required:** definition, explanation, comparison, procedure, calculation, or application as requested.

**Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

### Exam answer blueprint

For a short-answer question on Time of supply of services- Place of supply, begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. **Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

### Exam answer blueprint

For a short-answer question on GST reports – Return printing., begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

- What is GST reports – Return printing., and what is its scope in this module?
- Which elements, stages, types, quantities, or conditions must be named when explaining GST reports – Return printing.?
- How would you distinguish GST reports – Return printing. from a closely related idea?
- Where would an engineer or technician encounter GST reports – Return printing., and what must be checked before using it?
- What common mistake would make an answer or operation involving GST reports – Return printing. incorrect?

### Common mistakes and safety emphasis

- Copying a definition without explaining the mechanism or purpose.
- Listing terms without showing their relationship.
- Using an example that does not match the stated topic or condition.
- Leaving out a diagram, unit, assumption, limitation, or safety point when the question requires it.

### Module study tip

Read every topic in sequence, reproduce its example or procedure, and write a short explanation before attempting the module questions.

Learning map for Module module-2: the listed topics build the module competency.

### Concept and explanation

**Official scope.** The syllabus specifies **Duties and taxes**. The corresponding study scope is: Identify duties and taxes and methods of duties and taxes.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

**Technical treatment.** Use the official scope as a checklist. Relate each item to the neighbouring topics in the module, and distinguish normal operation from a fault, limitation, or incorrect assumption. In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

### Study points

- Define Duties and taxes using the official syllabus wording.
- Explain the sequence, relationship, calculation, or document procedure before listing details.
- Use a labelled diagram, table, formula, unit, or operating condition wherever it improves the answer.
- Connect the topic to an appropriate application and state one limitation, verification point, or common error.

**Engineering / workplace application:** Duties and taxes is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis.

**Illustrative example:** Revision task: Prepare a four-column note for Duties and taxes under the headings purpose, principle/procedure, important parameters, and application/limitation. Check every term in the official scope before moving to the next topic.

**Common mistake:** A common mistake is to reproduce isolated points for Duties and taxes without explaining their order, purpose, or engineering consequence.

# Handbook treatment

M2.01 — Duties and taxes (1 hours) is an official examinable part of the module. Study it as a connected explanation: define the central term, identify the related elements, explain their relationship, and finish with a relevant engineering use or limitation.

## Learning objectives

- Define and scope M2.01 — Duties and taxes (1 hours) using the official terminology retained above.
- Organise the important elements of M2.01 — Duties and taxes (1 hours) into a logical sequence, classification, structure, or calculation.
- Connect M2.01 — Duties and taxes (1 hours) with one engineering decision, operation, measurement, or safety requirement in the context of Duties, taxes and GST.
- Write an examination answer on M2.01 — Duties and taxes (1 hours) with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading M2.01 — Duties and taxes (1 hours). It is a study organisation method, not an additional official syllabus requirement.

- Start with the exact technical term and its scope.
- Separate the topic into named elements, stages, types, or conditions.
- Explain the relationship using cause-and-effect, sequence, comparison, or a labelled representation.
- Apply the idea to a realistic engineering situation and state one limitation or common mistake.

## Engineering application lens

The engineering value of M2.01 — Duties and taxes (1 hours) is understood by asking what requirement it satisfies, what input or condition it depends on, how the output is obtained, and how a technician or designer verifies the result. Use the module context to make the application specific rather than memorising an isolated definition.

## Worked answer method

**Given:** the topic, operating condition, diagram, data, or situation stated in the question.

**Required:** definition, explanation, comparison, procedure, calculation, or application as requested.

**Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

### Exam answer blueprint

For a short-answer question on M2.01 — Duties and taxes (1 hours), begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. # Handbook treatment

M2.04 — GST problems and reports (9 hours) must be learned as both a concept and a calculation procedure. The student should know what each quantity represents, the conditions under which a relation is valid, the unit of every quantity, and how to check whether the final answer is physically reasonable.

## Learning objectives

- Define and scope M2.04 — GST problems and reports (9 hours) using the official terminology retained above.
- Organise the important elements of M2.04 — GST problems and reports (9 hours) into a logical sequence, classification, structure, or calculation.
- Connect M2.04 — GST problems and reports (9 hours) with one engineering decision, operation, measurement, or safety requirement in the context of Duties, taxes and GST.
- Write an examination answer on M2.04 — GST problems and reports (9 hours) with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading M2.04 — GST problems and reports (9 hours). It is a study organisation method, not an additional official syllabus requirement.

- Identify the given quantities and write them with symbols and SI units.
- Select the governing definition, equation, graph, or relationship instead of starting with arithmetic.
- Substitute values only after checking units and the stated operating condition.
- Interpret the result in words and check its sign, magnitude, unit, and limiting behaviour.

## Engineering application lens

In an engineering setting, M2.04 — GST problems and reports (9 hours) is useful when a designer or technician must convert an observation into a measurable value, predict a response, compare alternatives, or verify that a component is operating within its rated condition. The practical question is always: what is measured or known, what is required, what model is appropriate, and how will the result be checked?

## Worked answer method

**Given:** the quantities and conditions stated in the question.

**Required:** the unknown quantity, including its unit.

**Calculation:** write the governing relation symbolically, substitute consistently converted values, and show the unit cancellation.

**Answer:** report the result with a suitable number of significant figures and one sentence of interpretation.

### Exam answer blueprint

For a short-answer question on M2.04 — GST problems and reports (9 hours), begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

- What is M2.04 — GST problems and reports (9 hours), and what is its scope in this module?
- Which elements, stages, types, quantities, or conditions must be named when explaining M2.04 — GST problems and reports (9 hours)?
- How would you distinguish M2.04 — GST problems and reports (9 hours) from a closely related idea?
- Where would an engineer or technician encounter M2.04 — GST problems and reports (9 hours), and what must be checked before using it?
- What common mistake would make an answer or operation involving M2.04 — GST problems and reports (9 hours) incorrect?

### Common mistakes and safety emphasis

- Using a memorised relation without checking its conditions.
- Mixing prefixes or units, such as milli, kilo, mega, seconds, minutes, or degrees.
- Reporting a numerical value without a unit or without explaining what it means.
- Rounding intermediate values so aggressively that the final answer changes.

### OFFICIAL MODULE 3

## Payroll processing

This module models payroll from employee attendance and pay-head setup to statements and statutory reports.

**Hours: 10**

**CO3 · Bloom level: Applying**

**Handbook study routine:** Complete Module 3 in three passes. First read the official source coverage and topic headings. Next study every Handbook treatment, writing the key definition, relationship, procedure, formula, diagram, or comparison in your own words. Finally close the notes and answer the self-check questions and the module questions without looking at the answer.

### Official source coverage for Module 3

Source basis: Official Contents block. Every point below is retained and linked to a study-oriented explanation. The main topic cards remain the primary lesson narrative.

## Point-by-point study guide

## — Official syllabus point 1: Pay roll

### Exact source point

**Syllabus text:** Pay roll

### How to understand and study it

This point is an official syllabus requirement: “Pay roll”. Treat every named term as an examinable subpoint. Define it, explain its role or behaviour, distinguish it from related terms, and connect it to the module application. The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

1. Write the exact technical term and a one-sentence definition in your own words.
2. List the named terms separately and add one distinguishing feature or engineering use for each.
3. Finish with one examination answer: definition, explanation, diagram/table if relevant, and application or limitation.

**Malayalam support:** ് syllabus point ് Pay roll ് technical terms English-്. ് definition ് principle ്; ് term-് function, difference, application ്. Diagram, sequence, formula, unit ് revision ്.

**Exam focus:** Answer this point with its definition or principle first, followed by the named features, sequence, comparison, formula, diagram, or application that the question demands.

# Handbook treatment

Pay roll is an official examinable part of the module. Study it as a connected explanation: define the central term, identify the related elements, explain their relationship, and finish with a relevant engineering use or limitation.

## Learning objectives

- Define and scope Pay roll using the official terminology retained above.
- Organise the important elements of Pay roll into a logical sequence, classification, structure, or calculation.
- Connect Pay roll with one engineering decision, operation, measurement, or safety requirement in the context of Payroll processing.
- Write an examination answer on Pay roll with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading Pay roll. It is a study organisation method, not an additional official syllabus requirement.

- Start with the exact technical term and its scope.
- Separate the topic into named elements, stages, types, or conditions.
- Explain the relationship using cause-and-effect, sequence, comparison, or a labelled representation.
- Apply the idea to a realistic engineering situation and state one limitation or common mistake.

## Engineering application lens

The engineering value of Pay roll is understood by asking what requirement it satisfies, what input or condition it depends on, how the output is obtained, and how a technician or designer verifies the result. Use the module context to make the application specific rather than memorising an isolated definition.

## Worked answer method

**Given:** the topic, operating condition, diagram, data, or situation stated in the question.

**Required:** definition, explanation, comparison, procedure, calculation, or application as requested.

**Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

## Exam answer blueprint

For a short-answer question on Pay roll, begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. - Apply the idea to a realistic engineering situation and state one limitation or common mistake.

## Engineering application lens

The engineering value of pay roll vouchers is understood by asking what requirement it satisfies, what input or condition it depends on, how the output is obtained, and how a technician or designer verifies the result. Use the module context to make the application specific rather than memorising an isolated definition.

## Worked answer method

**Given:** the topic, operating condition, diagram, data, or situation stated in the question.

**Required:** definition, explanation, comparison, procedure, calculation, or application as requested.

**Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

### Exam answer blueprint

For a short-answer question on pay roll vouchers, begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

- What is pay roll vouchers, and what is its scope in this module?
- Which elements, stages, types, quantities, or conditions must be named when explaining pay roll vouchers?
- How would you distinguish pay roll vouchers from a closely related idea?
- Where would an engineer or technician encounter pay roll vouchers, and what must be checked before using it?
- What common mistake would make an answer or operation involving pay roll vouchers incorrect?

### Common mistakes and safety emphasis

- Copying a definition without explaining the mechanism or purpose.
- Listing terms without showing their relationship.
- Using an example that does not match the stated topic or condition.
- Leaving out a diagram, unit, assumption, limitation, or safety point when the question requires it.

## — Official syllabus point 8: preparation of pay roll statement

### Exact source point

**Syllabus text:** preparation of pay roll statement

### How to understand and study it

This point is an official syllabus requirement: “preparation of pay roll statement”. Treat every named term as an examinable subpoint. Define it, explain its role or behaviour, distinguish it from related terms, and connect it to the module application. The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

1. Write the exact technical term and a one-sentence definition in your own words.
2. List the named terms separately and add one distinguishing feature or engineering use for each.
3. Finish with one examination answer: definition, explanation, diagram/table if relevant, and application or limitation.

### Module study tip

Read every topic in sequence, reproduce its example or procedure, and write a short explanation before attempting the module questions.

Learning map for Module module-3: the listed topics build the module competency.

### Concept and explanation

**Official scope.** The syllabus specifies **Payroll concept and basic terms**. The corresponding study scope is: Explain payroll, pay heads, basic terms and payroll features.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

### Study points

- Define Payroll concept and basic terms using the official syllabus wording.
- Explain the sequence, relationship, calculation, or document procedure before listing details.
- Use a labelled diagram, table, formula, unit, or operating condition wherever it improves the answer.
- Connect the topic to an appropriate application and state one limitation, verification point, or common error.

**Engineering / workplace application:** Payroll concept and basic terms is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis.

**Illustrative example:** Revision task: Prepare a four-column note for Payroll concept and basic terms under the headings purpose, principle/procedure, important parameters, and application/limitation. Check every term in the official scope before moving to the next topic.

**Common mistake:** A common mistake is to reproduce isolated points for Payroll concept and basic terms without explaining their order, purpose, or engineering consequence.

**Technical treatment.** Use the official scope as a checklist. Relate each item to the neighbouring topics in the module, and distinguish normal operation from a fault, limitation, or incorrect assumption. In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

**Malayalam support:** **Malayalam support:** Payroll statement and statutory reports എന്ന വിഷയം പഠിക്കുമ്പോൾ അതിന്റെ അർത്ഥം, പ്രാധാന്യം, പ്രവർത്തന രീതി, ഘട്ടങ്ങൾ, ഘടകങ്ങൾ, പ്രയോഗം, പരിമിതി, സുരക്ഷാ പരിശോധന എന്നിവയെക്കുറിച്ച് പഠിക്കുക. Standard technical terms English-ൽ ഉപയോഗിക്കുക.

### Study points

- Define Payroll statement and statutory reports using the official syllabus wording.
- Explain the sequence, relationship, calculation, or document procedure before listing details.
- Use a labelled diagram, table, formula, unit, or operating condition wherever it improves the answer.
- Connect the topic to an appropriate application and state one limitation, verification point, or common error.

**Engineering / workplace application:** Payroll statement and statutory reports is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis.

**Illustrative example:** Revision task: Prepare a four-column note for Payroll statement and statutory reports under the headings purpose, principle/procedure, important parameters, and application/limitation. Check every term in the official scope before moving to the next topic.

**Common mistake:** A common mistake is to reproduce isolated points for Payroll statement and statutory reports without explaining their order, purpose, or engineering consequence.

# Handbook treatment

M3.03 — Payroll statement and statutory reports (5 hours) is an official examinable part of the module. Study it as a connected explanation: define the central term, identify the related elements, explain their relationship, and finish with a relevant engineering use or limitation.

## Learning objectives

- Define and scope M3.03 — Payroll statement and statutory reports (5 hours) using the official terminology retained above.
- Organise the important elements of M3.03 — Payroll statement and statutory reports (5 hours) into a logical sequence, classification, structure, or calculation.
- Connect M3.03 — Payroll statement and statutory reports (5 hours) with one engineering decision, operation, measurement, or safety requirement in the context of Payroll processing.
- Write an examination answer on M3.03 — Payroll statement and statutory reports (5 hours) with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading M3.03 — Payroll statement and statutory reports (5 hours). It is a study organisation method, not an additional official syllabus requirement.

- Start with the exact technical term and its scope.
- Separate the topic into named elements, stages, types, or conditions.
- Explain the relationship using cause-and-effect, sequence, comparison, or a labelled representation.
- Apply the idea to a realistic engineering situation and state one limitation or common mistake.

## Engineering application lens

The engineering value of M3.03 — Payroll statement and statutory reports (5 hours) is understood by asking what requirement it satisfies, what input or condition it depends on, how the output is obtained, and how a technician or designer verifies the result. Use the module context to make the application specific rather than memorising an isolated definition.

## Worked answer method

**Given:** the topic, operating condition, diagram, data, or situation stated in the question.

**Required:** definition, explanation, comparison, procedure, calculation, or application as requested.

**Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

### Exam answer blueprint

For a short-answer question on M3.03 — Payroll statement and statutory reports (5 hours), begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

- What is M3.03 — Payroll statement and statutory reports (5 hours), and what is its scope in this module?
- Which elements, stages, types, quantities, or conditions must be named when explaining M3.03 — Payroll statement and statutory reports (5 hours)?
- How would you distinguish M3.03 — Payroll statement and statutory reports (5 hours) from a closely related idea?
- Where would an engineer or technician encounter M3.03 — Payroll statement and statutory reports (5 hours), and what must be checked before using it?
- What common mistake would make an answer or operation involving M3.03 — Payroll statement and statutory reports (5 hours) incorrect?

### Common mistakes and safety emphasis

- Copying a definition without explaining the mechanism or purpose.
- Listing terms without showing their relationship.
- Using an example that does not match the stated topic or condition.
- Leaving out a diagram, unit, assumption, limitation, or safety point when the question requires it.

## Point-by-point study guide

## — Official syllabus point 1: features settings

### Exact source point

**Syllabus text:** features settings

### How to understand and study it

This point is an official syllabus requirement: “features settings”. Treat every named term as an examinable subpoint. Define it, explain its role or behaviour, distinguish it from related terms, and connect it to the module application. The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

1. Write the exact technical term and a one-sentence definition in your own words.
2. List the named terms separately and add one distinguishing feature or engineering use for each.
3. Finish with one examination answer: definition, explanation, diagram/table if relevant, and application or limitation.

## – Official syllabus point 2: TDS calculations

### Exact source point

**Syllabus text:** TDS calculations

### How to understand and study it

This point is an official syllabus requirement: “TDS calculations”. Record the relevant quantity, symbol, unit, relation or formula, and the interpretation of the result. Do not memorise a number without its unit and condition. The main topic explanation above gives the concept context; this point-by-point section ensures that each named item is revised separately.

### Study sequence

1. Write the exact technical term and a one-sentence definition in your own words.
2. Record the symbol, SI unit, governing relation, and one correctly labelled calculation.
3. Finish with one examination answer: definition, explanation, diagram/table if relevant, and application or limitation.

**Malayalam support:** ് syllabus point ് TDS calculations ് technical terms English-്. ് definition ് principle ്; ് term-് function, difference, application ്. Diagram, sequence, formula, unit ് ് revision ്.

**Exam focus:** Answer this point with its definition or principle first, followed by the named features, sequence, comparison, formula, diagram, or application that the question demands.

# Handbook treatment

TDS calculations must be learned as both a concept and a calculation procedure. The student should know what each quantity represents, the conditions under which a relation is valid, the unit of every quantity, and how to check whether the final answer is physically reasonable.

## Learning objectives

- Define and scope TDS calculations using the official terminology retained above.
- Organise the important elements of TDS calculations into a logical sequence, classification, structure, or calculation.
- Connect TDS calculations with one engineering decision, operation, measurement, or safety requirement in the context of TDS, stock and pricing.
- Write an examination answer on TDS calculations with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading TDS calculations. It is a study organisation method, not an additional official syllabus requirement.

- Identify the given quantities and write them with symbols and SI units.
- Select the governing definition, equation, graph, or relationship instead of starting with arithmetic.
- Substitute values only after checking units and the stated operating condition.
- Interpret the result in words and check its sign, magnitude, unit, and limiting behaviour.

## Engineering application lens

In an engineering setting, TDS calculations is useful when a designer or technician must convert an observation into a measurable value, predict a response, compare alternatives, or verify that a component is operating within its rated condition. The practical question is always: what is measured or known, what is required, what model is appropriate, and how will the result be checked?

## Worked answer method

**Given:** the quantities and conditions stated in the question.

**Required:** the unknown quantity, including its unit.

**Calculation:** write the governing relation symbolically, substitute consistently converted values, and show the unit cancellation.

**Answer:** report the result with a suitable number of significant figures and one sentence of interpretation.

### Exam answer blueprint

For a short-answer question on TDS calculations, begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

- How would you distinguish TDS calculations from a closely related idea?
- Where would an engineer or technician encounter TDS calculations, and what must be checked before using it?
- What common mistake would make an answer or operation involving TDS calculations incorrect?

### Common mistakes and safety emphasis

- Using a memorised relation without checking its conditions.
- Mixing prefixes or units, such as milli, kilo, mega, seconds, minutes, or degrees.
- Reporting a numerical value without a unit or without explaining what it means.
- Rounding intermediate values so aggressively that the final answer changes.

## Self-check questions

- What is valuation., and what is its scope in this module?
- Which elements, stages, types, quantities, or conditions must be named when explaining valuation.?
- How would you distinguish valuation. from a closely related idea?
- Where would an engineer or technician encounter valuation., and what must be checked before using it?
- What common mistake would make an answer or operation involving valuation. incorrect?

## Common mistakes and safety emphasis

- Copying a definition without explaining the mechanism or purpose.
- Listing terms without showing their relationship.
- Using an example that does not match the stated topic or condition.
- Leaving out a diagram, unit, assumption, limitation, or safety point when the question requires it.

### Module study tip

Read every topic in sequence, reproduce its example or procedure, and write a short explanation before attempting the module questions.

Learning map for Module module-4: the listed topics build the module competency.

### Concept and explanation

**Official scope.** The syllabus specifies Tax deducted at source concept. The corresponding study scope is: Explain TDS, terms and feature settings.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write input → transformation → output → verification. For a design or management method, write objective → assumptions → method → result → limitation.

| Application            | Tax deducted at source concept is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis. |

**Technical treatment.** Use the official scope as a checklist. Relate each item to the neighbouring topics in the module, and distinguish normal operation from a fault, limitation, or incorrect assumption. In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

## Study points

- Define Tax deducted at source concept using the official syllabus wording.
- Explain the sequence, relationship, calculation, or document procedure before listing details.
- Use a labelled diagram, table, formula, unit, or operating condition wherever it improves the answer.
- Connect the topic to an appropriate application and state one limitation, verification point, or common error.

**Engineering / workplace application:** Tax deducted at source concept is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis.

**Illustrative example:** Revision task: Prepare a four-column note for Tax deducted at source concept under the headings purpose, principle/procedure, important parameters, and application/limitation. Check every term in the official scope before moving to the next topic.

**Common mistake:** A common mistake is to reproduce isolated points for Tax deducted at source concept without explaining their order, purpose, or engineering consequence.

# Handbook treatment

M4.01 — Tax deducted at source concept (1 hours) is an official examinable part of the module. Study it as a connected explanation: define the central term, identify the related elements, explain their relationship, and finish with a relevant engineering use or limitation.

## Learning objectives

- Define and scope M4.01 — Tax deducted at source concept (1 hours) using the official terminology retained above.
- Organise the important elements of M4.01 — Tax deducted at source concept (1 hours) into a logical sequence, classification, structure, or calculation.
- Connect M4.01 — Tax deducted at source concept (1 hours) with one engineering decision, operation, measurement, or safety requirement in the context of TDS, stock and pricing.
- Write an examination answer on M4.01 — Tax deducted at source concept (1 hours) with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading M4.01 — Tax deducted at source concept (1 hours). It is a study organisation method, not an additional official syllabus requirement.

- Start with the exact technical term and its scope.
- Separate the topic into named elements, stages, types, or conditions.
- Explain the relationship using cause-and-effect, sequence, comparison, or a labelled representation.
- Apply the idea to a realistic engineering situation and state one limitation or common mistake.

## Engineering application lens

The engineering value of M4.01 — Tax deducted at source concept (1 hours) is understood by asking what requirement it satisfies, what input or condition it depends on, how the output is obtained, and how a technician or designer verifies the result. Use the module context to make the application specific rather than memorising an isolated definition.

## Worked answer method

**Given:** the topic, operating condition, diagram, data, or situation stated in the question.

**Required:** definition, explanation, comparison, procedure, calculation, or application as requested.

**Method:** organise the answer under principle, named elements, sequence or relationship, and application.

**Answer:** use the requested technical terms, units, labels, assumptions, and a concluding statement.

### Exam answer blueprint

For a short-answer question on M4.01 — Tax deducted at source concept (1 hours), begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

# Handbook treatment

M4.03 — TDS problems (5 hours) must be learned as both a concept and a calculation procedure. The student should know what each quantity represents, the conditions under which a relation is valid, the unit of every quantity, and how to check whether the final answer is physically reasonable.

## Learning objectives

- Define and scope M4.03 — TDS problems (5 hours) using the official terminology retained above.
- Organise the important elements of M4.03 — TDS problems (5 hours) into a logical sequence, classification, structure, or calculation.
- Connect M4.03 — TDS problems (5 hours) with one engineering decision, operation, measurement, or safety requirement in the context of TDS, stock and pricing.
- Write an examination answer on M4.03 — TDS problems (5 hours) with a clear opening, technical middle, and final application or limitation.

## Conceptual framework

Use the following frame while reading M4.03 — TDS problems (5 hours). It is a study organisation method, not an additional official syllabus requirement.

- Identify the given quantities and write them with symbols and SI units.
- Select the governing definition, equation, graph, or relationship instead of starting with arithmetic.
- Substitute values only after checking units and the stated operating condition.
- Interpret the result in words and check its sign, magnitude, unit, and limiting behaviour.

## Engineering application lens

In an engineering setting, M4.03 — TDS problems (5 hours) is useful when a designer or technician must convert an observation into a measurable value, predict a response, compare alternatives, or verify that a component is operating within its rated condition. The practical question is always: what is measured or known, what is required, what model is appropriate, and how will the result be checked?

## Worked answer method

**Given:** the quantities and conditions stated in the question.

**Required:** the unknown quantity, including its unit.

**Calculation:** write the governing relation symbolically, substitute consistently converted values, and show the unit cancellation.

**Answer:** report the result with a suitable number of significant figures and one sentence of interpretation.

### Exam answer blueprint

For a short-answer question on M4.03 — TDS problems (5 hours), begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. - What common mistake would make an answer or operation involving M4.03 — TDS problems (5 hours) incorrect?

### Common mistakes and safety emphasis

- Using a memorised relation without checking its conditions.
- Mixing prefixes or units, such as milli, kilo, mega, seconds, minutes, or degrees.
- Reporting a numerical value without a unit or without explaining what it means.
- Rounding intermediate values so aggressively that the final answer changes.

### Exam answer blueprint

For a short-answer question on M4.04 — Stock valuation in Tally (1 hours), begin with the definition or principle and include the decisive feature. For a medium-answer question, add the named elements and their functions or sequence. For a long-answer question, add a labelled diagram, comparison, formula or procedure where relevant, one application, and one limitation or safety point. Never substitute a list of headings for the explanation.

### Self-check questions

- What is M4.04 — Stock valuation in Tally (1 hours), and what is its scope in this module?
- Which elements, stages, types, quantities, or conditions must be named when explaining M4.04 — Stock valuation in Tally (1 hours)?
- How would you distinguish M4.04 — Stock valuation in Tally (1 hours) from a closely related idea?
- Where would an engineer or technician encounter M4.04 — Stock valuation in Tally (1 hours), and what must be checked before using it?
- What common mistake would make an answer or operation involving M4.04 — Stock valuation in Tally (1 hours) incorrect?

### Common mistakes and safety emphasis

- Copying a definition without explaining the mechanism or purpose.
- Listing terms without showing their relationship.
- Using an example that does not match the stated topic or condition.
- Leaving out a diagram, unit, assumption, limitation, or safety point when the question requires it.

**Malayalam support:** M4.04 — Stock valuation in Tally (1 hours) താഴെ വിഷയം സംബന്ധിച്ചുള്ള കൃത്യമായ technical term ഉപയോഗിക്കുക. നിങ്ങളുടെ definition ഉപയോഗിച്ച് principle, named parts/steps, application, limitation എന്നിവ വിശദീകരിക്കുക. English terminology, symbols, units, diagram labels ഉപയോഗിക്കുക. Exam answer രചിക്കുമ്പോൾ concept-കൾക്ക് ഉദാഹരണങ്ങൾ ഉൾപ്പെടുത്തുക.

**Module summary:** Verify tax deduction, ledger posting, voucher evidence and stock valuation method before final reporting.

## Formula and Notation Bank

**Formula note:** The supplied syllabus is primarily procedural or conceptual and does not prescribe a compulsory numerical formula bank. Focus on the official terminology, sequences, records, and practical demonstrations listed in the modules.

## Official Activities and Practical Requirements

**Official activities / self-learning**

- Create a practice company, enter representative transactions, reconcile bank data, configure GST/payroll/TDS, generate reports, and retain an audit trail without using personal financial data.

### Practical requirements / equipment

- Computer laboratory with Tally software or the syllabus-prescribed accounting package; sample company data; printer or report-export facility.

## Assessment Methodology

Official assessment information is reproduced below from the supplied syllabus.

- The supplied PDF lists Series Test entries, but it does not provide a complete official CIE/ESE mark distribution or a complete question-paper pattern.
- Series Test – I is listed in the supplied syllabus; the PDF does not provide a complete mark distribution for this entry.
- Series Test – II is listed in the supplied syllabus; the PDF does not provide a complete mark distribution for this entry.
- The practice model paper in this lesson is a study aid and is explicitly not an official examination paper.

## Module-wise Questions and Answers

### module-1 — Bank reconciliation and company data management

#### 1. Explain Bank reconciliation statement and Tally audit features. [3 marks]

**Official scope.** The syllabus specifies **Bank reconciliation statement and Tally audit features**. The corresponding study scope is: Interpret bank reconciliation statement and Tally audit features; understand buttons, computation and bank-book balance.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result →**

limitation.

| Aspect                 | Expected learning                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Meaning                | Define the official term and distinguish it from closely related terms.                                                                                                                  |
| Principle or procedure | Explain the sequence, governing idea, calculation method, or document workflow.                                                                                                          |
| Engineering check      | State the parameter, accuracy, speed, cost, reliability, safety, or compliance condition to verify.                                                                                      |
| Application            | Bank reconciliation statement and Tally audit features is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis. |

**Technical treatment.** Use the official scope as a checklist. Relate each item to the neighbouring topics in the module, and distinguish normal operation from a fault, limitation, or incorrect assumption. In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

**Exam focus:** State the definition or purpose, explain the working or sequence, and add one application or caution.

## 2. Explain Preparation of bank reconciliation statement. [3 marks]

**Official scope.** The syllabus specifies *Preparation of bank reconciliation statement*. The corresponding study scope is: Prepare bank reconciliation statement in Tally.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

**Exam focus:** State the definition or purpose, explain the working or sequence, and add one application or caution.

## module-2 — Duties, taxes and GST

### 4. Explain Duties and taxes. [3 marks]

**Official scope.** The syllabus specifies *Duties and taxes*. The corresponding study scope is: Identify duties and taxes and methods of duties and taxes.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

| Principle or procedure | Explain the sequence, governing idea, calculation method, or document workflow.                                                                              |
| Engineering check      | State the parameter, accuracy, speed, cost, reliability, safety, or compliance condition to verify.                                                          |
| Application            | GST registration and rates is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis. |

**Technical treatment.** Use the official scope as a checklist. Relate each item to the neighbouring topics in the module, and distinguish normal operation from a fault, limitation, or incorrect assumption. In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

**Exam focus:** State the definition or purpose, explain the working or sequence, and add one application or caution.

## 7. Explain GST problems and reports. [3 marks]

**Official scope.** The syllabus specifies **GST problems and reports**. The corresponding study scope is: Solve GST problems including CGST/SGST ledgers and calculations, cess, GST reports and return printing.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

| Aspect                 | Expected learning                                                                                                                                          |

## module-3 — Payroll processing

### 8. Explain Payroll concept and basic terms. [3 marks]

**Official scope.** The syllabus specifies **Payroll concept and basic terms**. The corresponding study scope is: Explain payroll, pay heads, basic terms and payroll features.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

| Aspect                 | Expected learning                                                                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Meaning                | Define the official term and distinguish it from closely related terms.                                                                                           |
| Principle or procedure | Explain the sequence, governing idea, calculation method, or document workflow.                                                                                   |
| Engineering check      | State the parameter, accuracy, speed, cost, reliability, safety, or compliance condition to verify.                                                               |
| Application            | Payroll concept and basic terms is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis. |

**Technical treatment.** Use the official scope as a checklist. Relate each item to the neighbouring topics in the module, and distinguish normal operation from a fault, limitation, or incorrect assumption. In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

**Exam focus:** State the definition or purpose, explain the working or sequence, and add one application or caution.

## 9. Explain Payroll heads, attendance and vouchers. [3 marks]

**Official scope.** The syllabus specifies *Payroll heads, attendance and vouchers*. The corresponding study scope is: Create attendance, pay heads and payroll vouchers.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

| Aspect                 | Expected learning                                                                                                                                                        |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Meaning                | Define the official term and distinguish it from closely related terms.                                                                                                  |
| Principle or procedure | Explain the sequence, governing idea, calculation method, or document workflow.                                                                                          |
| Engineering check      | State the parameter, accuracy, speed, cost, reliability, safety, or compliance condition to verify.                                                                      |
| Application            | Payroll heads, attendance and vouchers is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis. |

**Technical treatment.** Use the official scope as a checklist. Relate each item to the neighbouring topics in the module, and distinguish normal operation from a fault, limitation, or incorrect assumption. In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

**Exam focus:** State the definition or purpose, explain the working or sequence, and add one application or caution.

## 10. Explain Payroll statement and statutory reports. [3 marks]

**Official scope.** The syllabus specifies *Payroll statement and statutory reports*. The corresponding study scope is: Prepare payroll statement and payroll statutory reports.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

| Aspect  | Expected learning        |

| Payroll statement and statutory reports is applied in computerized financial accounting practice, documentation, troubleshooting, design review, or examination analysis. |

**Technical treatment.** Use the official scope as a checklist. Relate each item to the neighbouring topics in the module, and distinguish normal operation from a fault, limitation, or incorrect assumption. In an examination answer, use the exact technical vocabulary, a labelled diagram or table where useful, and state units or assumptions for numerical work.

**Exam focus:** State the definition or purpose, explain the working or sequence, and add one application or caution.

## module-4 — TDS, stock and pricing

### 11. Explain Tax deducted at source concept. [3 marks]

**Official scope.** The syllabus specifies *Tax deducted at source concept*. The corresponding study scope is: Explain TDS, terms and feature settings.

**How to study the topic.** Begin with the exact definition or purpose, then identify the important elements, working sequence, variables or controls, and the performance or safety condition that must be checked. For a process, write **input → transformation → output → verification**. For a design or management method, write **objective → assumptions → method → result → limitation**.

7. Define or explain *Tax deducted at source concept* with one relevant application. (5 marks)
8. Define or explain *Expense ledgers and TDS vouchers* with one relevant application. (5 marks)

**Writing advice:** Use headings, standard terminology, and labelled diagrams or procedures where relevant.

## Quick Revision

### Module-wise key points

- **Bank reconciliation and company data management:** A reconciliation is complete only when the difference is explained and the final balance is documented.
- **Duties, taxes and GST:** Tax calculations must distinguish the tax type, taxable value, rate, ledger and reporting period.
- **Payroll processing:** A payroll audit trail should connect attendance, pay head, voucher, statement and statutory report.
- **TDS, stock and pricing:** Verify tax deduction, ledger posting, voucher evidence and stock valuation method before final reporting.

## Exam checklist

- Write the official terminology before adding explanation.
- Use a labelled diagram or step sequence when it improves the answer.
- Check conditions, boundaries, safety, hygiene, and documentation points.
- Separate official syllabus information from your own example.

**Last-minute revision:** Review the coverage table, formula bank, diagram library, and common-mistake notes inside every topic.
